

# Different Types of Artificial Intelligence

## Artificial Intelligence (AI)

An umbrella term for any machine that mimics part or all of human intelligence.

## Machine Learning (ML)

A subset of AI that enables computers to learn and adapt without being explicitly programmed.

## Reinforcement Learning (RL)

An agent learns to make decisions and take actions in an environment, receiving feedback or rewards based on the outcomes.

## Deep Learning (DL)

An advanced form of ML that uses multilayered neural networks to process and learn from vast amounts of data.

## Natural Language Processing (NLP)

A form of AI that has the ability to understand text and spoken language similar to human understanding.

## Computer Vision (CV)

A field of AI that focuses on processing and understanding visual data such as images or videos.

## Large Language Models (LLMs)

A type of foundational deep neural network models trained on vast amounts of text. They are designed to understand, generate, and transform human-like language.

## Generative Artificial intelligence (GenAI)

A form of AI that can ingest information and generate new content such as text, audio, image, video, and even computer code.
